

WHAT IS THE SPATIAL INFORMATION SERVICE?

The Spatial Information Service is part of the Improvement Service. It provides technical support and guidance to improve the management and availability of spatial information owned by Scottish local government. The service is responsible for the development and operational management of the **Spatial Hub**, the **One Scotland Gazetteer** and **TellmeScotland**.

The service works directly for Scottish local government and collaborates closely with strategic partners to ensure that improved spatial information management increases value to data owners and the wider Scottish community. It keeps the local government community up to date on Scottish, UK and EU legislation and regulation, including INSPIRE, and supports Scottish local government to achieve compliance.

The Spatial Information Service will, in time, help to centralise the efforts associated with the improvement of spatial information management across Scottish local government, resulting in long term efficiency gains and cost savings by using software, systems and methods which are innovative, reliable and of world class excellence. This includes a cloud hosted technical infrastructure built with open source software as well as a portal (www.spatialhub.scot) to allow the upload and download of spatial data.

Public Information Notices for Scotland

Tellme Scotland is a portal for accessing public information notices issued by local authorities across Scotland. Here you can:

- > Search for public notices such as planning and licensing in your area
- > Check roadworks and restrictions on any route that you choose
- > Search archived notices across the country
- > Register to receive alerts by text or email on notices in your area

Select an area on the map, or from the list below to view notices in that area.

National datasets will also be available commercially to non OSMA/PSMA organisations via engagement with our partner organisations (from April 2018).
